Valtek Pressure-balanced Trim

GENERAL INSTRUCTIONS

The following instructions are designed to assist in disassembly, reassembly and troubleshooting of Valtek® control valves equipped with pressure-balanced trim. Product users and maintenance personnel should thoroughly review this bulletin in conjunction with Mark One and Mark Two Control Valves Installation, Operation, and Maintenance Instructions (IOM 1), Valtek Part No. 49011 and the appropriate positioner IOM bulletin.

This publication does not contain information on installing, maintaining, troubleshooting, calibrating, and operating Valtek positioners. Refer to Mark One and Mark Two Control Valves Installation, Operation, and Maintenance Instructions (IOM 1), when this information is required.

WARNING: Depressurize line to atmospheric pressure, drain all process fluids and decontaminate the valve (if caustic or hazardous materials are present). Failure to do so could cause serious injury.

1. Fully retract the plug until the stem clamp indicator points to the open position.
2. Remove the bonnet flange bolting and lift the actuator, bonnet and plug out of the valve body.
3. Fully extend the plug by applying air above the piston, allowing the sleeve to remain in the body and the bonnet to raise above the body.
4. In the gap between the top of the sleeve and the bottom of the bonnet, place wooden blocking of equal thickness in at least three places.
5. By applying air below the piston, retract the plug until the plug head is freed from the sleeve.
6. If the sleeve has not been removed with the plug, lift...
it out of the valve body.
7. Remove seat ring and gaskets from the valve body.
8. Remove the plug seals from the plug head.
9. The plug may be removed from the actuator and bonnet [See Mark One and Mark Two Control Valves Installation, Operation, and Maintenance Instructions (IOM 1)].

Reassembly of Pressure-balanced Trim
To reassemble Valtek control valves equipped with pressure-balanced trim, refer to Figure 2 and proceed as follows:

1. Carefully inspect the plug head and sleeve bore for signs of galling and scoring. Superficial scoring can be removed with a light application of emery cloth. If more serious scoring exists, contact the local Valtek control valve representative. Also, check to see if the seating surfaces on both the seat ring and plug are free of damage.

2. If the plug has been removed from the bonnet and actuator, reinstall it according to the instructions outlined in Mark One and Mark Two Control Valves Installation, Operation, and Maintenance Instructions (IOM 1).

3. To replace the plug seals on the plug, refer to Figure 1 and observe the following directions:
   - **PTFE Seals** – Heat one seal to 300° F (150° C) and slip it over the plug into the seal groove. Thermal expansion causes the ring to stretch, thereby making it relatively easy to slide over the plug head.
   - **CAUTION**: Because of the high ductility of NiResist metal piston rings, care must be taken to prevent expanding of the ring during assembly.
   - **O-ring with Back-up Rings** – Both the O-ring and back-up rings can stretch over plug and into place.

4. Install a new seat gasket and relocate the seat ring.

5. Install the sleeve, bonnet gasket and sleeve gasket.

6. Lower the actuator, bonnet and plug assembly squarely into the sleeve bore. If PTFE or O-ring seals are used, the plug may remain retracted while entering the sleeve. Care should be taken with these seals to avoid scoring or galling the sealing surface while fitting them into the sleeve bore. With metal piston ring seals, the plug must be extended a few inches to allow the use of a ring compressor on the metal rings. A suitably sized screw-type hose clamp will also serve to compress the rings for reassembly.

*Figure 1: Plug Seal Configurations*
7. Once the bonnet is resting squarely in the valve body, tighten the bonnet flange bolting to finger-tightness.

8. Using the actuator, seat the plug two or three times to center the seat ring.

9. Leaving the plug in seated position, begin tightening the bonnet flange bolting so as to keep the bonnet square with valve body. Tighten a bolt 1/6 turn (one flat), then tighten the bolt directly opposite 1/6 turn. Continue tightening all bolts in this manner until the bonnet is firmly seated, metal to metal, in the body. This can be easily felt through the wrench.

10. Slowly stroke the plug up and down to check the alignment of the plug with the sleeve.

CAUTION: If binding or sticking is observed, discontinue stroking the valve and reassemble using the above steps. Failure to do so could cause serious valve damage.
### Troubleshooting Chart

<table>
<thead>
<tr>
<th>Failure</th>
<th>Probable Cause</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jerky stem travel</td>
<td>1. Overtightened graphite packing</td>
<td>1. Graphite packing is often associated with jerky stem movement; therefore, only tighten the packing box enough to prevent leakage.</td>
</tr>
<tr>
<td></td>
<td>2. Galling or scoring between the plug and the sleeve</td>
<td>2. Superficial scoring or galling may be removed with a light application of emery cloth; if more serious damage exists, contact the factory.</td>
</tr>
<tr>
<td></td>
<td>3. Overtightened packing</td>
<td><strong>CAUTION:</strong> Trim parts are machined to close tolerances which are essential for correct functioning of the valve. Attempting to remove deep scratches could result in high leakage rates or improper valve functioning.</td>
</tr>
<tr>
<td></td>
<td>4. Service temperature exceeds operating parameter of trim design</td>
<td>3. Adjust the packing box nuts to slightly over-finger-tight (over-tightening will also cause excessive packing wear and high stem friction).</td>
</tr>
<tr>
<td></td>
<td>5. Inadequate air supply</td>
<td>4. Reconfirm service conditions and contact factory</td>
</tr>
<tr>
<td></td>
<td>6. Malfunctioning positioner</td>
<td>5. Check for leaks in the air supply of instrument signal system; tighten any loose connections and replace any leaky lines</td>
</tr>
<tr>
<td></td>
<td></td>
<td>6. Refer to positioner maintenance instructions</td>
</tr>
<tr>
<td>Excessive leakage</td>
<td>1. Insufficiently tightened bonnet flange bolting</td>
<td>1. Refer to step 9 of the <em>Reassembly</em> section for correct tightening procedure.</td>
</tr>
<tr>
<td></td>
<td>2. Worn or damaged seat ring</td>
<td>2. Disassemble and replace or repair seat ring; for correct procedure on remachining the seat ring see <em>Mark One and Mark Two Control Valves</em> (IOM 1)</td>
</tr>
<tr>
<td></td>
<td>3. Worn or damaged plug seals</td>
<td>3. Disassemble and replace plug seals</td>
</tr>
<tr>
<td></td>
<td>4. Worn or damaged gaskets</td>
<td>4. Disassemble and replace gaskets</td>
</tr>
<tr>
<td></td>
<td>5. Inadequate actuator thrust</td>
<td>5. Check for adequate air supply to the actuator; if supply is correct, reconfirm service conditions and contact factory</td>
</tr>
<tr>
<td></td>
<td>6. Incorrectly adjusted plug</td>
<td>6. Refer to <em>Mark One and Mark Two Control Valves</em> (IOM 1) and correct plug adjustment</td>
</tr>
<tr>
<td>Valve does not fail in correct direction</td>
<td>1. Incorrect flow direction</td>
<td>1. Reconfirm flow direction and, if necessary, correct flow direction through valve.</td>
</tr>
<tr>
<td></td>
<td>2. Galling or scoring between plug and sleeve</td>
<td>2. See No. 2, ‘Jerky stem travel’ (above)</td>
</tr>

Flowserve Corporation has established industry leadership in the design and manufacture of its products. When properly selected, this Flowserve product is designed to perform its intended function safely during its useful life. However, the purchaser or user of Flowserve products should be aware that Flowserve products might be used in numerous applications under a wide variety of industrial service conditions. Although Flowserve can (and often does) provide general guidelines, it cannot provide specific data and warnings for all possible applications. The purchaser/user must therefore assume the ultimate responsibility for the proper sizing and selection, installation, operation and maintenance of Flowserve products. The purchaser/user should read and understand the Installation Operation Maintenance (IOM) instructions included with the product, and train its employees and contractors in the safe use of Flowserve products in connection with the specific application.

While the information and specifications presented in this literature are believed to be accurate, they are supplied for informative purposes only and should not be considered certified or as a guarantee of satisfactory results by reliance thereon. Nothing contained herein is to be construed as a warranty or guarantee, express or implied, regarding any matter with respect to this product. Because Flowserve is continually improving and upgrading its product design, the specifications, dimensions and information contained herein are subject to change without notice. Should any question arise concerning these provisions, the purchaser/user should contact Flowserve Corporation at any of its worldwide operations or offices.
